

Barbara Louyakis's Portfolio

Project 1: Web Development Course

Northeastern University

Northeastern
University

Objective

- Create a personal portfolio that displays my education & professional work, current employment, current projects and contact information
- Learn how to use HTML5 and ensure the code is W3C compliant
- Create custom styles using CSS3
- Write JavaScript Vanilla ES6 to generate unique features on my page
- Use Bootstrap 5.3.8 grids and navbars
- Implement ESLint to highlight errors in the code
- Implement Prettier to make my code clean and easy to read
- Personalize the page with Google Fonts and unique color themes

Technologies used

- CSS Variables: Used to define my color theme so I could easily reference the colors while adding to the CSS file. This made it easier when decided which colors to use because I only had to update the color once instead of throughout the entire CSS file.
 - `:root { --navy: 1a2e4a; --pink-light: #f261ac; }`
- CSS Transitions & Hover: Added better visuals to the page using transitions in the navbar, section cards & buttons so they change when the mouse moves over them.
 - Transition: all 0.2s ease
 - Added hover style to the CSS stylesheet
- Google Fonts: Amethysta provided by Google that lets you import font style by adding a `<link>` tag in the HTML head.
- Smooth Scroll: Added scroll feature for smooth scrolling across all pages.
 - Scroll-behavior: smooth

What I'm proud of

I decided to create my own pages before creating the GenAI pages. I wanted the website to be entirely my own unique style. I used Bootstrap to get the general navbar layout and the grid that I used for the cards. I modified the navbar quite a bit to make it my own. If the website is viewed on a device, the words condense into a 3-bar icon for easy navigation. Then I integrated Claude Sonnet 4-6 into VSCode so the AI could access my code. I provided one single prompt to generate the 'Professional' and 'Education' pages, and I also provided my resume for reference. AI did a good job matching my style without being too complicated.

Prompt: "I want you to role play as a professional web developer. I will share my resume with you. I want you to use the information from my resume to generate the education.html & professional.html pages."

What I struggled the most with

The navbar took the most time. I did not want to copy it exactly from Bootstrap so I used the template as a start and spent hours modifying and adjusting it to something I loved.

Finding an eye-catching color theme took some time. I tried quite a few combinations and eventually settled with a navy/pink theme. AI suggested adding teal into the 'Professional' and 'Education' pages which really made those pages stand out.

Getting the image at the bottom of the homepage just the right shape and size was confusing at first. I still have work to do on getting everything perfectly centered as well.
